

When you open the Polysix (4 screws on the top face and four screws on the bottom at the back-- then the top will flip up)... the battery is right in front of you, just a little left of centre... It *looks* like a cordless phone battery held by clips but DON'T try to pry it out as the clips are spot welded to the battery pack and the whole battery pack is soldered to the board. You will have to remove the board with the battery on it and desolder it from the back side... I've heard the battery is available from Radio Shack... In which case it WILL be a cordless phone battery (3.6 volts, 17ma)... If you tell them you need a battery for your Korg Polysix they will just look you with that blank RadioShack stare... :)
